# 1 SBC 2.6 structuring

- 1. Alarm and Information panel
- 2. Control panel
- 3. Inputting panel

# 2 SBC 2.6 display- and control elements

## 2.0 General

At parameter level and configuration level, the values can only be changed after releasing parameter C1 at configuration level. For this purpose, parameter C1 must be set to OFF.

## 2.1 Inputting Panel

### 1. P-Taste

#### Change-over switch

for accessing the individual processing levels:

**working level:** push the „P“ key

**parameter level:** push „P“ and „ENTER“ keys simultaneously

**Configuration level:** keep „P“ and „ENTER“ keys depressed simultaneously for about 4s.

### 2. Acknowledgement -/ canceling-key (Enter)

All alterations ▲ and ▼ must be confirmed!

(Set- values and parameters)

### 3. Value-alteration key

For increasing set-and parameter-values

**Attention!**

Confirm with "Enter ↵"!

### 4. Value-alteration key

For reducing the set- and parameter-values

**Attention!**

Confirm with "Enter ↵"!

### 5. ON Button

system "working"; pump and controls "active"

### 6. OFF key

All systems "OFF", LED is alight, for as long as voltage supply is live

## 2.2 Control Panel

### 1. Display PROCESS

Display of pre-runt temperature's actual-value

Display of parameter designation, when operating at working-, parameter- and configuration-level

### 2. Display SET

Display of the current or programmed set-values

Display of numerical values or parameter values when at working-, parameter- and configuration-level

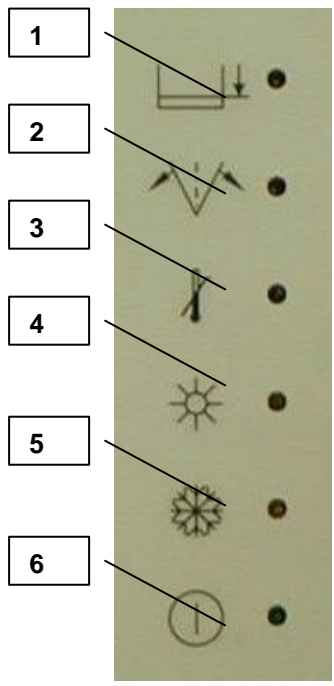

## 2.3 Drain function

The drain function is started by pressing simultaneously the P and 0 keys.

## 2.4 Alarm Panel and Display - Information

Fault / Operational status	Cause	Rectification / explanation	
1	Minimum level not made	<u>Water:</u> with manual filling: replenish with heat transfer medium. With automatic filling: Open cooling water supply, wait till filled. <u>Oil:</u> Fill or replenish with oil	
2	Limit-comparator outside band-spread limiting value exceeded	Not up to temperature, or outside band-spread (limit) Band-spread too narrow or limiting value made Turn OFF at working level, parameter AL, or set band-spread.	
3	Pre-run temperature up to limiting value Heating switches OFF	Check set limiting value; insufficient heat dissipation by consumer subsequent to cooling by 5 K, heating comes ON again	
4	Heating on		
5	Cooling on		
6	Temperature control unit ON	LED flashes when the temperature control unit is switched off via the pump after-run control.	

### 3 Parameter description SBC 2.6

#### 3.0 Working level

##### 3.0.1 Calling-up the working level

This is how the working level is accessed.

Push button marked P

Individual parameters are accessed by pushing the button marked P

The PROCESS-display shows the parameter

The SET-display shows the parameter value

##### 3.0.2 Parameter description at working level

Abbreviations:

MR-start = Measuring range start (minimum -30°C)

MR-end = Measuring range end (maximum +400°C)

Parameter	Set-values range		Signifying	SBC V2.6	
	des.	start			
<b>AL</b>	OFF	OFF	Alarm outputs selected.	X	
	OFF, -99	100	Alarm output programmed as signal contact ❶ max. OFF-ON. The setting-value corresponds to the alarm's response value, relative to the setpoint-value.	X	
	MR-start	MR-end	Alarm output programmed as limiting contact ❷ max OFF-ON. The setpoint-value corresponds to the absolute response-value of the alarm.	X	
	OFF, 0	100	Alarm output programmed as limit comparator ❸ OFF-ON-OFF. The setpoint-value corresponds to the setpoint's tolerance-value.	X	
	OFF, -99	100	Alarm output, programmed as signal contact ❹ max. ON-OFF. The setting-value corresponds to the alarm's response value, relative to the setpoint-value.	X	
	MR-start	MR-end	Alarm output programmed as limiting contact ❺ max ON-OFF. The setpoint-value corresponds to the absolute response-value of the alarm.	X	
	OFF, 0	100	Alarm output programmed as limit comparator ❻ ON-OFF-ON. The setpoint-value corresponds to the setpoint's tolerance-value.	X	

	OFF, 0	100	Alarm output programmed as limit comparator <b>ON-OFF-ON</b> (with stand-by response). The setpoint-value corresponds to the setpoint's tolerance-value. No alarm during initial start-up, until the input range is made.	X	
--	--------	-----	---	---	--

Parameter	Set-values range		Signifying	SBC V2.6	
	des.	start			
<b>AP.I</b>	MR-start	MR-end	Programmed value corresponds to the response temperature of the inlet-temperature limitation. If up to end of measuring range is programmed, the value end of measuring range + 5 °C is displayed.	X	
<b>Ati</b>	OFF=0	40	Aquatimer: setpoint-value corresponds to the max. permissible filling cycles after 1 hour of operation.	X	
<b>Cti</b>	OFF, 10	900	Change time; evacuation / vacuum time on units with automatic mold draining. Setpoint -value corresponds to the compressed-air assisted evacuation time or else the vacuum-time in seconds.	X	
<b>LS</b>	OFF	on	Turning the leak-stop mode ON and OFF ON means leak-stop mode turned ON OFF means leak-stop mode turned OFF  <b>this parameter is displayed only with the 2C, t.95 and C.Oil operating mode selected-</b>	X	
<b>AL 2</b>	OFF	OFF	Alarm output OFF.		
	OFF, -99	100	Alarm output programmed as signal contact max. OFF-ON. The setting value corresponds to alarm trip threshold relative to the setpoint.  <b>This parameter is displayed only with the 2C operating mode selected.</b>		
<b>niv</b>	Hand	Auto	<b>Hand</b> = manual filling of the unit <b>Auto</b> = automatical filling of the unit <b>Auto</b> not possible at heat transfer units with oil	X	
<b>Adr</b>	1	255	Inputting of unit addressing.  If several units are operated by the same interface, different addresses must be input.  <b>Only for units with interface!</b>	X	

### 3.1 Parameter level

#### 3.1.1 Calling-up the parameter level

How to get into the parameter level

Push buttons P and ↵ simultaneously

Individual parameters are accessed by pushing the button marked P

The PROCESS-display shows the parameter

The SET-display shows the parameter value

#### 3.1.2 Parameter description at parameter level

Parameter	Set-values range		Signifying	SBC V2.6
	Des.	Start		
<b>hP</b>	OFF, 0.1	99.9	XP-Heating The control system's proportional range	X
<b>hd</b>	OFF, 1	200	TV-Heating in s. Derivative action time of the control system	X
<b>hl</b>	OFF, 1	999	TN-Heating in s. Integral action (reset) time of the control system	X
<b>cP</b>	OFF, 0.1	99.9	XP-Cooling The control system's proportional range	X
<b>cd</b>	OFF, 1	200	TV-cooling in s. Derivative action time of the control system	X
<b>cl</b>	OFF, 1	999	TN-cooling in s. Integral action (reset) time of the control system	X
<b>db</b>	OFF, 0.1	10.0	Switching hysteresis between heating and cooling This parameter is used for increasing the set-value (switching point) for cooling by the value entered. That way, possibly too frequently occurring switching changes between heating- and cooling modes can be prevented. Simultaneous switching of heating and cooling can be ruled out generally. Settings are in °C.	X

Parameter	Set-values range		Signifying	SBC V2.6	
	Start	End			
<b>Des.</b>					
<b>hC</b>	1	240	Heating switch-cycle time in s.	X	
<b>cC</b>	1	240	Cooling switch-cycle time in s.	X	
			<p>The control element's maximum switching frequency is determined with the assistance of the switch-cycle time. This is the period, during which the controller carries out one <b>ON</b> and one <b>OFF</b> switching action.</p> <p>We recommend the following settings:</p> <ul style="list-style-type: none"> <li>Relay-setting outputs with downstream installed contactors; switching cycle &gt; 10 s</li> <li>Bi-stable voltage output ports for actuating Solid State Relays (SSR): Switch-cycle time 1 ... 10 s</li> </ul>		
<b>SPH</b>	SPL	MB-end	Upper setpoint limitation in °C. Here the final value for the setpoint setting range can be selected.	X	
<b>SPL</b>	MB-start	SPH	Lower setpoint limit in °C. The start value of the setpoint adjustment range can be preselected here.	X	
<b>SCL</b>	OFF, 35	90	<b>S</b> ystem <b>C</b> losed = system shut-off on units employable at > 90°C, the water system is shut-off to atmosphere.		
<b>C-F</b>	C	0,1 F	Selection °C, °F or 1/10 °C	X	
<b>OPt</b>	OFF	on	Turning self-optimization ON and OFF.  ON = Self-optimization startet. The controller determines the optimum control parameters by closed-loop control.	X	
<b>Sd</b>	0.5	10	<b>Switching hysteresis for 2C mode</b> <b>Programmed value acts symmetrically to required value setting</b>		
<b>h</b>			operating hours		

### 3.2 Configuration level

#### 3.2.1 Calling up the configuration level

How to get admitted to the configuration level:

Setting keys P and ↵ simultaneously (about 4s), until LOC parameter appears in the PROCESS-display

Individual parameters are accessed by pushing the button marked P

The PROCESS-display shows the parameter

The SET-display shows the parameter value

#### 3.2.2 Parameter description at configuration level

Parameter	Set-values range		Signifying	SBC V2.6	
	Des.	Start			
<b>LOC</b>	OFF	PC	Keyboard interlock <ul style="list-style-type: none"> <li>• OFF= parameter values can be changed.</li> <li>• PC = Parameter level and configuration level barred. Parameters can only be viewed.</li> </ul>	X	
<b>C.Co</b>	t.95	C.Oil	Selection of operating mode t.95 = Temperature control units up to 90°C t.150 = Temperature control unit up to 150°C and higher 2C = Refrigerator C.Oil = Heat transfer units up to 300°C	X	
<b>C.AL</b>	OFF	7	Configuration of the alarm <ul style="list-style-type: none"> <li>• OFF = Alarm has been turned OFF</li> <li>• 1 = Signal contact OFF-ON</li> <li>• 2 = Limiting contact OFF-ON</li> <li>• 3 = Limit comparator OFF-ON-OFF</li> <li>• 4 = Signal contact ON-OFF</li> <li>• 5 = Limiting contact ON-OFF</li> <li>• 6 = Limit comparator ON-OFF-ON</li> <li>• 7 = Limit comp. with stand-by response</li> </ul>	X	

Parameter	Set-values range		Signifying	SBC V2.6	
	Start	End			
<b>Des.</b>					
<b>C.SA</b>	oP	cL	Configuration group interrupt <ul style="list-style-type: none"> <li>oP = n/c contact</li> <li>cL = n/o contact</li> </ul>	X	
<b>ASt</b>	5 min	120	<ul style="list-style-type: none"> <li>Aquatimer-Start-time (min)</li> </ul> <p>Aquatimer (filling-impulse-counter) becomes active following the time set in the "ASt". Previously not monitored random filling cycles. Renewed start of the "AST" time, following the On/Off.</p>	X	
<b>EMO</b>	OFF	on	Restart lockout after power reset <ul style="list-style-type: none"> <li>off = Restart lockout not active</li> <li>on = Restart lockout active</li> </ul> <p>Following a power reset, the control system stays turned OFF, to start with. Display "Info". "EMO" message – flashing.</p>	X	
<b>OF1</b>	OFF, -100	100	Temperature correction of the internal temperature probe in °C	X	
<b>Pro</b>	OFF	A	Setting of the various interface protocols <ul style="list-style-type: none"> <li>OFF = interface mode turned OFF</li> <li>A = Arburg-protocol active</li> <li>E = Engel- protocol active</li> </ul>	X	
<b>tty</b>	20nA	422	Setting and preselecting the physical interface <p>422 = RS 485 - 4-wire 20nA = TTY 20mA current loop</p>	X	
<b>PS1</b>	0	999	The set parameters are stored by inputting a secret code. <b>In preparation</b>	X	
<b>C.60</b>	OFF, 10	100	Release or locking of the software key pump timer control <p>If the "0" key is pressed, it is cooled down to the set temperature and the device is switched off.</p> <ul style="list-style-type: none"> <li>"OFF" = "OFF" key is locked</li> <li><b>10...100 °C = adjustable cut-out temperature</b></li> </ul>	X
